

Calculation notes for the synthetic example

Version 0.1-rc.2 retains the fictional SR-01 inputs and original worked-example narrative. The workbook adds a documented-failed-check input and companion judgment measures.

Seven verified requirements + three verified recovery checks = ten verified checks. Three failed requirements + one failed recovery check = four documented failures. Two recovery checks are unassessed. These disjoint statuses total sixteen mandatory checks.

The original synthetic calculations remain: reference recall 62.5%, expected-recall gap +17.5 percentage points, omission recognition 33.3%, recovery coverage 50%, requirements coverage 70%, and batch false-ready acceptance 75%.

All four fictional batch judgments are decisive, so decision coverage is 100% and decisive false-ready acceptance is 75%. No criterion-ready instances were supplied; their false-hold and abstention measures are N/A. These numbers are an arithmetic demonstration, not observed outcomes.
